Data Analyst Interview, Technical Round

Answer each question out loud before you listen to the model answer.

Q: Walk me through how you would validate a dashboard nobody trusts.

A: Start by finding where the numbers diverge from the source of truth, then rebuild one metric together with the stakeholder. Trust comes back through one reconciled number, not through a new dashboard.

Q: How do you handle a stakeholder who wants a metric you think is misleading?

A: Separate the decision they are trying to make from the metric they asked for. Offer the metric they want alongside the one that actually moves the decision, and let both live.

Q: Explain a time you found a data quality bug that changed a decision.

A: Name the bug, how long it had been live, who had seen the wrong number, and what you changed in the pipeline so it could not recur silently.

Notes

Bring one example where the correct answer was to do nothing.
